

Fish aquaculture

The food they eat is made of lots of ingredients often from unsustainable sources.

Wild salmon are in very low numbers so now nearly all of the salmon we eat are farmed.

Aquaculture helps to reduce pressure on wild fish populations.

Farming fish provides fish all year round.

Fish are in high numbers in the pens which can cause spread of diseases and parasites.

If farmed fish escape they can spread disease to wild fish.

Aquaculture is growing to match a growing world population.

Uneaten fish food, waste chemicals and fish waste sinks to the seafloor causing pollution.
