

Fight climate change

Our ocean is a hero in the fight against climate change

Carbon dioxide (CO₂) is one of the damaging greenhouse gases produced by human activity

Seagrass is an ocean superhero, absorbing carbon up to 35 times faster than tropical rainforests

Coastal habitats like seagrass meadows, native oyster beds and saltmarshes help to capture and store CO₂

Our ocean captures and stores around 25% of the CO₂ we release into the atmosphere

For our ocean to help us to fight climate change, we must improve the way we use and protect it.
